

Forms 11g modules are saved with an 'fmb' extension, this format allows the Developer to open existing Modules for re-editing.

Forms can be saved at any time to the Operating System using the standard 'Save' or 'Save As' options found in all Windows products.

An option exists in the Program menu to revert a Module back to the current saved Module in Operating System. It is well to remember that in Forms 'undo' only goes back one step, therefore small changes should be saved frequently.
