

This second example takes the `first_value` and uses it to work out the difference between the first year of trading and the subsequent years, the code looks a little more complicated but it is merely subtracting one column from another ...

```
select brand as "Brand"  
      ,rpad(year,4) as "Current Year"  
      ,sold as "Qty"  
      ,first_value(sold) over (order by year asc) as "First Year"  
      ,sold - first_value(sold) over (order by year asc) as "Difference"  
from car_sales  
where brand = 'BMW'  
order by year asc
```
