

PHP Arrays – Populating Associative Arrays

At any point the Associative Array can be added to either using numeric or String key values ...

```
$courses["Discoverer Administrator"] = "3 Days";  
echo $courses["Discoverer Administrator"];
```

In addition a blank key can be added and the Array will use the next available number ...

```
$courses[] = "Oracle Forms";  
echo $courses[36];
```

The same technique applies to Numeric Arrays.
