

If the User defines a spool file with a zip extension, SQLcl will automatically convert the output into a zip file.

Only one file will be created within the file and this will have the name of the zip with a .out extension.

Once switched off the zip file cannot be appended to as this will invalidate the entire file. Obviously best suited to a large dump of data.

```
Worksheet | Query Builder
-----|-----
spool c:\course\zippedOutput.zip
select * from club_65;
spool off
```
