

The Spool command can be extended to allow Append, Replace and Create

*spool <filename> create* – Creates the file if not already in existence, if create is specified it will not allow creation if the file already exists, this will give the following error ...

The screenshot shows the SQL Developer interface. The top pane is the Query Builder, containing the following SQL code:

```
spool c:\course\output create
select c65_member_id from club_65;
spool off
```

The bottom pane is the Script Output window, which displays the following error message:

```
SP2-0771: File "c:\course\output.LST" already exists.
Use another name or "SPOOL filename[.ext] REPLACE"
```
